A most unique, compact, and quality-engineered precision computation instrument is the SP-70. The perfect tool for all engineers, scientists, statisticians, financiers, and students.

With 8 data registers, the SP-70 instantly performs a multitude of mathematical functions. And *Total Algebraic Logic™* makes it extremely simple to operate. All expressions are entered in exactly the same sequence as they are stated. This includes the signs, numbers (in full floating decimal or scientific notation), function instructions, *even the brackets and parentheses*. Without ever needing to reprogram the expression.

In fact, *Total Algebraic Logic™* is so advanced that most calculations, no matter how complex, may be solved without manually entering any intermediate results into memory. The dual-level parenthetical system—one component of Poly-Memory™—automatically directs intermediate results into sub-memory and conditions these intermediate results for automatic retrieval when necessary. Thus freeing the separate memory register for storing any other data at your option. For example, the SP-70 quickly solves the following—just the way you see it:

$$r = \frac{Q_0}{(\mu_e \epsilon^2)} \left[(e^x - 1) \frac{X}{L} - e^{-\mu_e} + 1 \right]$$

$$\left[(t_2 - t_1) \frac{X}{L} (\mu_e X + 1) \right]$$
